To the Hiring Team,

I will keep this brief, as I understand the saturation of the applicant market. I am an individual motivated by curiosity and communal wellbeing – I believe that the best works come out of collaboration from experts in our own fields. I see this in my dragonboat team, my contributions to the ASPIRE lab at Triumph, and at work.

My career has been characterized by exploration, which led me to pursue my degree in mathematics. As my perspective developed, I noticed that the core of many fields was in maths, and that by "learning the hard stuff first," I could more easily pursue my interdisciplinary goals. I have found this to be true, as I have been able to make meaningful contributions as a mechanical engineer, physicist, and full-stack software developer. Softening my skillset, I have worked front-of-house in restaurants & bars, and rose to an editorial position at my university's student newspaper, which has enabled me to build diverse connections within the wealth of community that surrounds me.

The breadth of experience that I bring makes me confident I am a great fit for the demands and culture at Traction Rec.

I am self-motivated, capable, and take ownership of my work. I strive for first-principles understanding whenever possible, and understand the value of communication between peers when working in a team.

Cordially,

Jacob
